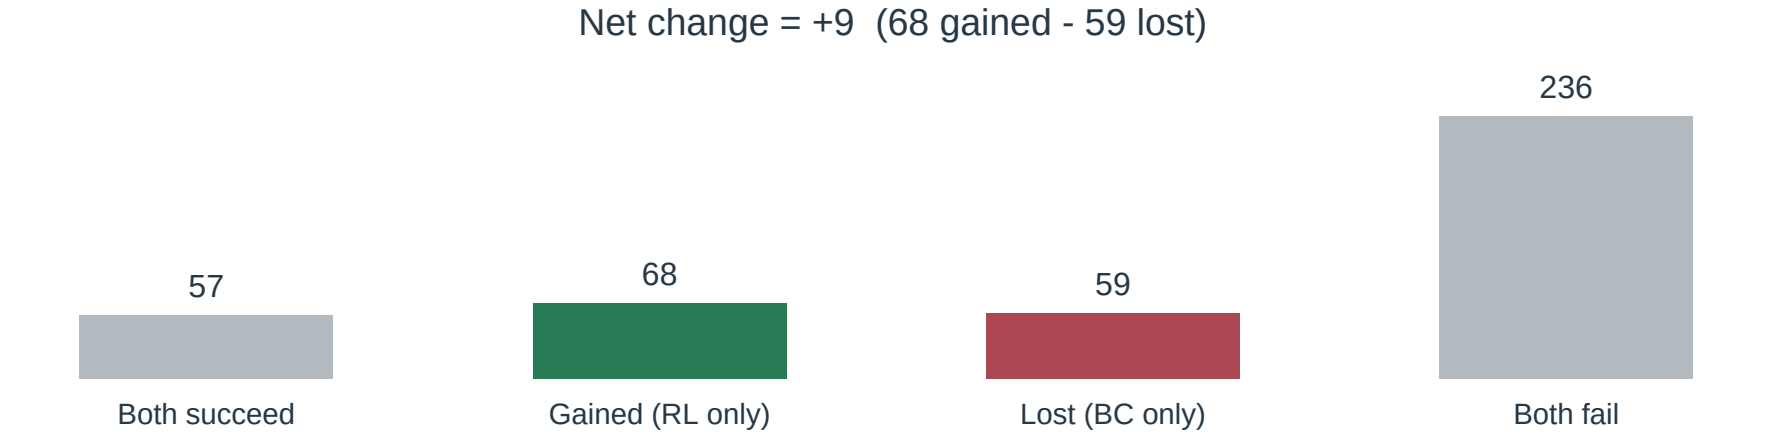
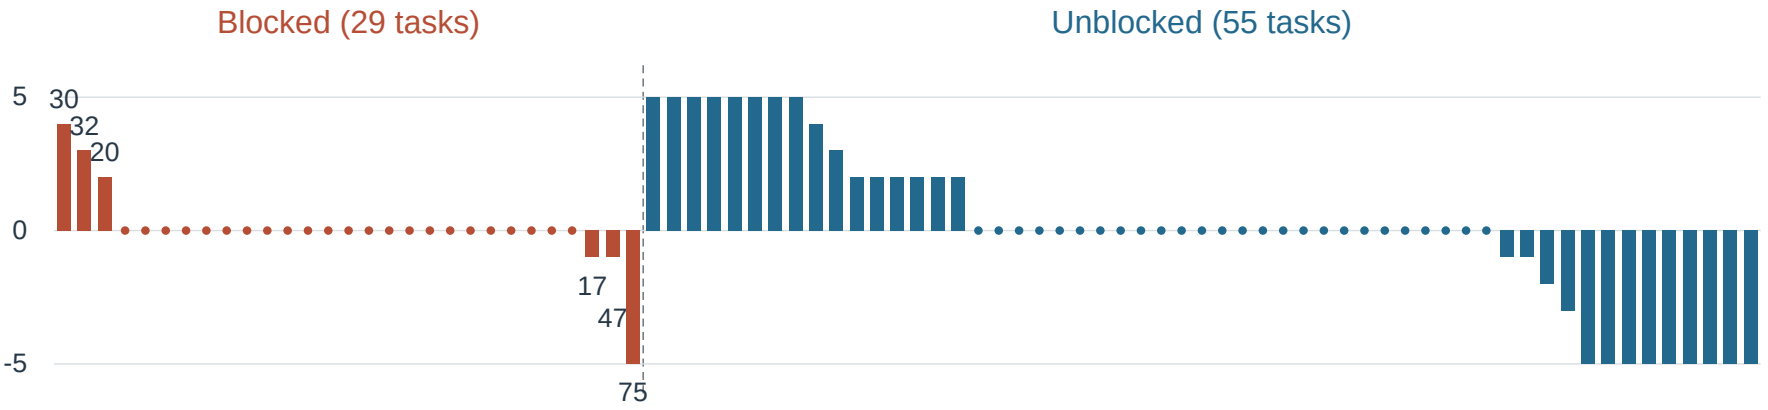
(a) Safe-arrival exchange: 420 paired evaluations



(b) Net arrival change per task: RL - BC (five repeats)



Grouped by initial direct-path obstruction; sorted by change, then task ID.

Labels identify blocked tasks with changes. Dots retain all zero-net tasks.

19 improved / 16 declined / 49 zero net; no gain-loss cancellation in zero-net tasks.

Binary outcomes isolate arrival exchange; collision / timeout transitions are in Table S2.4.
